25X1

1. At the beginning of August 1952 the Rakosi Works at Csepel began the manufacturing of a product, labeled as "HG 307". The foreman described the product as a "plow cart rear wheel".
2. The mould was in the shape of a round piston, with three couplings on one side, while in the middle of the other side a stump protruded from the piston. A spherical section was etched into this stump. The material was of cast high-strength steel. The moulds were then delivered to Assembly Hall "K4", where they were further processed.
3. On the basis of the subsequent stages of the processing, it became apparent that the "plow cart wheel" was in reality the tube mount for the 8 cm. mortar. In the assembly hall the tubular supports (connecting with the wheel) were begun and the tube clamps mounted on them. From here the mortar mounts were taken to Workshop No. 6907 for further assembly.
4. Each week 46 of the tube mounts were fitted out with tubular supports.
